For Immediate Release

Needham and Associates Inc is pleased to announce a trademark has been granted for CD² Needham's concurrent design and detailing process. CD² accelerates schedules, provides earlier predictable costs, and fewer risks.

CD² accelerates or eliminates many of the tedious steps that are often times the downfall of many conventional steel projects. Because of this process streamlining, the production schedule is greatly accelerated. The normal, critical path bottleneck of steel framing is no longer a subject of worry. The extra time that has been created allows more time for the bidding process to occur using the actual fabrication drawings rather than the generalized S-sheet of the structural engineer. There is more time to bid, creating a more competitive bidding environment, simultaneously reducing the risk for the entire project team.

Needham's proprietary BIM software BIG-DADi powers the concurrent design and detailing process.
